The subject of multivariable analysis is of interest to pure and applied mathematicians, physicists, electrical, mechanical and systems engineers, mathematical economists, biologists, and statisticians. This introductory text provides students and researchers in the above fields with various ways of handling some of the useful but difficult concepts encountered in dealing with the machinery of multivariable analysis and differential forms on manifolds. The approach here is to make such concepts as concrete as possible. Highlights and key features: systematic exposition, supported by numerous examples and exercises from the computational to the theoretical brief development of linear algebra in Rn review of the elements of metric space theory treatment of standard multivariable material: differentials as linear transformations,...
